POSSIBLE VERSIONS OF ~~CLUSTER~~ HOUSE-CLUSTER-WHOLE

1. A main street, with well defined clusters opening off it,
   each cluster with a common area, say 50x100, with provate
   lots around, each say 40x70, with the house itself towards
   the outside of the private land, to make positive space at garden
   level, and with arcades or trellises, around common land,
   connecting houses, to make positive space for the cluster
   as a whole. Assume clusters are connected laterally, to make
   connections <u>between</u> clusters, not merely via main street.
   ~~On main street~~ This means there is a secondary form of circulation,
   parallel to mainstreet, but very informal, squeezed between houses,
   etc.

2. A main street, which is formed, by a chain of houses, like
   Martinez house. These houses ~~are~~ have a back side, opening on
   the open country. The houses exist in short chains which form
   clusters. The land inside these clusters, surrounded by the
   houses, is ambiguous, sort of private, sort of public, in
   sense that cluster members share it. Main street space is very
   strong, cluster not so strong in this case.

3. A version similar to type 1, in which clusters are clearly
   defined, open off a main street, and have lateral connection
   parallel to main street: but in this case there is no
   private land (except perhaps a tiny area, nestled in corner
   of each house). Essentially, in this version, all land is
   common, and houses are placed in such a way as to form the
   common land most effectively. The good thing about this version

is that common land is evry strong; private land ᵻₓ only

exists where needed. Provisions have to be made, to assure

each person of expansion space into ᵽₘᵦᵢᵢₓₘ open land, for

extra bedrooms, rasiing chickens, flower garden, whatever...

4. A version in which ᵗₕₓₓ there is a main street, and a

secondary street on each side, parallel to main street,

with houses on either side of this ₓₐᵢₙₓₐₖₘₑ ₓ secondary

street. In ₓ this version, there are, again, private lots,

with houses courtlike around these lots, to form "good"

private garden space. Cluster exists as a loose informal

grouping of these houses, probably in fours or sixes, two or

three on either side of the secondary road. There is a ₚₘₓₕₐᵢₓₘ

 problem, in this version, that front of house is not on

main street, so main street made up of lots of backs.

(Actually this problem exists also in version 1 and 3, though

not so acutely).

5. Similar to 4, but without private lots. In this case, we

have an imaginary ᵣₓₐₓ secondary road, parallel tomain

street, we place houses in clusters, around this ₓₘₐₘₘ

"road", This becomes quite similar to versions 1 and 3,

except that secondary ₘₓₘₓₐᵢ momvement parallel to main

street is more pronounced, and again, as in 4, ₐᵢ main street

suffers, perhaps, from houses not knowing which way to face.
